

After decades of monopoly profits at the expense of the American consumer, cable companies are facing real competition.

American consumers love that 5G Home Broadband has brought competition and real broadband choice. Americans are breaking up with their Cableopoly in record numbers.

Cable could compete with 5G with a better product or better service. Instead, cable has launched a massive D.C. influence campaign to starve wireless of the spectrum needed to compete.

You know, what a monopolist would do.

To ensure more Americans benefit from the better service that comes with home broadband choice, America needs more full-power, licensed spectrum for 5G.

Cable's Wi-Fi Whopper

The Cableopoly is working hard to starve 5G of the spectrum needed to compete. Now Cable is telling another whopper, claiming Wi-Fi can do everything 5G can. Wi-Fi might work fine at home or the office, but its small coverage area, poor security, unreliable performance, and lack of mobility means Wi-Fi doesn't hold a candle to 5G.

Not Truly Independent.

Unlike 5G, Wi-Fi doesn't connect you directly to the internet on its own. It still depends on a wired broadband service. It's the Cableopoly's way of chaining you to the same cable internet service you've been limited to for years.

Not Mobile.

While 5G offers high speed, nationwide coverage everywhere you go, Wi-Fi only covers a small area, so it can't update map applications while you're driving, or maintain a video call moving from place-to-place. Imagine if your phone didn't work outside your house.

Not As Secure.

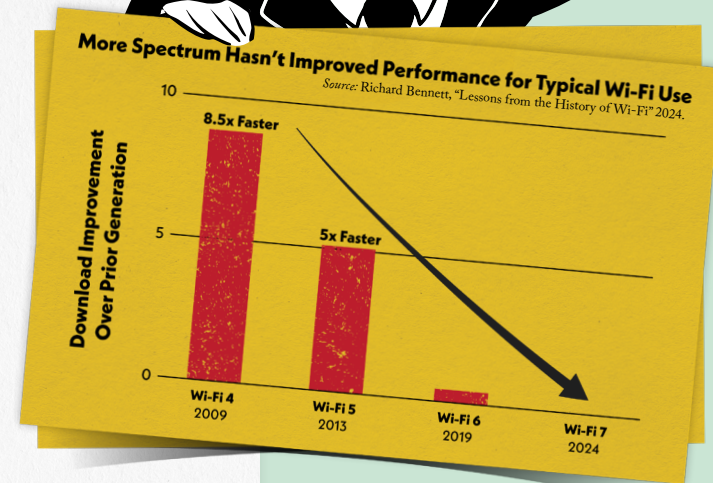

5G has the highest level of security built-in, Wi-Fi networks are not as secure, and many Wi-Fi devices are not updated or managed, making for security risks.

Not Keeping Up.

Wi-Fi has access to a lot more mid-band spectrum than 5G—about 3 times as much. But most people haven't seen a big change in their Wi-Fi experience in over a decade. Meanwhile, mobile speeds on 5G have skyrocketed—getting more than 80 times faster since 2013.

Failing America's Business Sector.

We are starting to see some of America's leading companies dump Wi-Fi, saying it doesn't offer the reliability, scalability, latency or performance that's available with licensed networks.
